Dear Mr. Koerner:

This attached article is about Qigong for curing high blood pressures. It is very powerful. It can drop 5-20 mm Hg right after each session of practice, if the person really gets the point. I practiced it for a few times, I changed my own blood pressures dramatically. I now distribute this booklet freely to general public. Many cancer patients might have high blood pressures caused by dull pains.

This article extensively discusses disease moving thermodynamic potential and the conditions for curing cancer and other diseases. I must conclude that cancer is the most curable disease. Cancer growth is very disfavored biologically and thermodynamically. It becomes unmanageable only when it becomes sufficient large (due to the cell division law and the immune system shut down). So, the strategy is to use all potential factors boost the immune system and whole body wellness to tip the moving "balance" from net growth to net reduction. This has been very successful in China. My suggestion is that we need to introduce Guolin's cancer Qigong. I do not believe that everything taught in her books is right, but we need to explore the art from rigid scientific basis. I have successfully combined Qigong, medical discovery, and basic science to become a unified art. I also give very rationale explanation of the miracles. Finding cures is not just a possibility but an absolute reality.

I discuss five required conditions for curing cancer and chronic diseases. My theory leaves little room for challenges, given the massive amount of brain research findings. More and more new findings will support my theory. New findings point to the brain's state-locking mechanism.

I hope ACS can do something to find cures for cancer and all other chronic diseases in a faster track. I do not know what ACS could do to speed up the course for finding cures. Now most of the research grants are established for drug discovery and cannot be used for sports.

The stake is tens of millions premature deaths. Cares are what everyone wants to enjoy.

Best regards,

John Wu, Ph.D.
